- **Hyper Text:** HyperText simply means "Text within Text." HyperText is a way to link two or more web pages (HTML documents) with each other.
- **Markup language:** apply layout and formatting conventions to a text document. Markup language makes text more interactive and dynamic. It can turn text into images, tables, links, etc.
- Web page can be of the static or dynamic type
- An HTML document is made of many HTML tags and each HTML tag contains different content.

Description of HTML Example

- **<!DOCTYPE>**:instruct the browser about the version of HTML.
 - **<html >** :This tag informs the browser that it is an HTML document
 - **<head>**: It should be the first element inside the <html> element, which contains the metadata(information about the document). It must be closed before the body tag opens.
 - **<title>**: appears at the top of the browser window. It must be placed inside the head tag and should close immediately.
 - **<body>** : Text between body tag describes the body content of the page that is visible to the end user.
 - **Tim Berners-Lee** is known as the father of HTML.
-

- W3C (World Wide Web Consortium)
- WHATWG(Web Hypertext Application Technology Working Group)

Features of HTML

- easy and simple language.
 - effective presentation
 - markup language
 - facilitates programmers to add a link on the web page
 - platform-independent
 - facilitates the programmer to add Graphics, Videos, and Sound
 - HTML is a case-insensitive language
-

- Text editors are the programs which allow editing in a written text.
- basic building blocks
 - **Tags:** HTML tag surrounds the content and apply meaning to it.
 - **Attribute:** provides extra information about the element
 - **Elements:** In an HTML file, everything written within tags are termed as HTML elements.
- `<tag name attribute_name= " attr_value"> content </ tag name>`
- HTML tags are like keywords which defines that how web browser will format and display the content.
- with the help of tags, a web browser can distinguish between an HTML content and a simple content.
- But some HTML tags are unclosed tags.
- Each HTML tags have different properties.
- All HTML tags must enclosed within < > these brackets.

HTML Tags are always written in lowercase letters

- **
 Tag:** br stands for break line, it breaks the line of the code.
- **<hr> Tag:** hr stands for Horizontal Rule. This tag is used to put a line across the webpage.

HTML Meta Tags

- DOCTYPE, title, link, meta and style

HTML Text Tags

- `<p>`, `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>`, ``, ``, `<abbr>`, `<acronym>`, `<address>`, `<bdo>`, `<blockquote>`, `<cite>`, `<q>`, `<code>`, `<ins>`, ``, `<dfn>`, `<kbd>`, `<pre>`, `<samp>`, `<var>` and `
`

HTML Link Tags

- <a> and <base>

HTML Image and Object Tags

- , <area>, <map>, <param> and <object>

HTML List Tags

- , , , <dl>, <dt> and <dd>

HTML Table Tags

- table, tr, td, th, tbody, thead, tfoot, col, colgroup and caption

HTML Form Tags

- form, input, textarea, select, option, optgroup, button, label, fieldset and legend

HTML Scripting Tags

- script and noscript
-

HTML Attribute

- HTML attributes are special words which provide additional information about the elements or attributes
 - Attributes should always be applied with start tag.
 - The Attribute should always be applied with its name and value pair.
 - `<element attribute_name="value">content</element>`
 - **Style** attribute is used for applying CSS property on any HTML element
 - **title** attribute is used as text tooltip in most of the browsers.
 - IN HTML5, you can also omit use of quotes around attribute values.
-

HTML Elements

- elements are responsible for creating web pages and define content in that webpage.
- an element is a collection of start tag, attributes, end tag, content between them.

Some elements does not have end tag and content, these elements are termed as empty elements or self-closing element or void elements. These elements are also called as unpaired tag.

- default display and styling purpose in HTML, all the elements are divided into two categories:
 - Block-level element
 - Inline element
- Block-level element
 - structure main part of web page, by dividing a page into coherent blocks.
 - block-level element always start with new line and takes the full width of web page, from left to right.
 - <address>, <article>, <aside>, <blockquote>, <canvas>, <dd>, <div>, <dl>, <dt>, <fieldset>, <figcaption>, <figure>, <footer>, <form>, <h1>-<h6>, <header>, <hr>, , <main>, <nav>, <noscript>, , <output>, <p>, <pre>, <section>, <table>, <tfoot>, and <video>.

Inline elements:

- differentiate the part of a given text and provide it a particular function.
- These elements does not start with new line and take width as per requirement.
- The Inline elements are mostly used with other elements.
- <a>, <abbr>, <acronym>, , <bdo>, <big>,
, <button>, <cite>, <code>, <dfn>, , <i>, , <input>, <kbd>, <label>, <map>, <object>, <q>, <samp>, <script>, <select>, <small>, , , <sub>, <sup>, <textarea>, <time>, <tt>, <var>.

HTML Formatting

- formatting tags are divided into two categories:
 - Physical tag: These tags are used to provide the visual appearance to the text.
 - Logical tag: These tags are used to add some logical or semantic value to the text.

NOTE: There are some physical and logical tags which may give same visual appearance, but they will be different in semantics.

This is a physical tag, which is used to bold the text written between it.

	This is a logical tag, which tells the browser that the text is important.
<i>	This is a physical tag which is used to make text italic.
	This is a logical tag which is used to display content in italic.
<mark>	This tag is used to highlight text.
<u>	This tag is used to underline text written between it.
<tt>	This tag is used to appear a text in teletype. (not supported in HTML5)
<strike>	This tag is used to draw a strikethrough on a section of text. (Not supported in HTML5)
<sup>	It displays the content slightly above the normal line.
<sub>	It displays the content slightly below the normal line.
	This tag is used to display the deleted content.
<ins>	This tag displays the content which is added
<big>	This tag is used to increase the font size by one conventional unit.
<small>	This tag is used to decrease the font size by one unit from base font size.

- tag is a logical tag, which displays the content in bold font and informs the browser about its logical importance.

HTML Heading

- Headings in HTML helps the search engine to understand and index the structure of web page.
- H1 to h6

HTML Paragraph

- It is a notable point that a browser itself add an empty line before and after a paragraph.

If we are using various <p> tags in one HTML file then browser automatically adds a single blank line between the two paragraphs

- If you put a lot of spaces inside the HTML p tag, browser removes extra spaces and extra line while displaying the page. The browser counts number of spaces and lines as a single one.
-
 tag is used for line break and it can be used with paragraph elements.
- <hr> tag is used to apply a horizontal line between two statements or two paragraphs

HTML Phrase tag

- The HTML phrase tags are special purpose tags, which defines the structural meaning of a block of text or semantics of text.
- Abbreviation tag : <abbr>
 - tag is used to abbreviate a text. To abbreviate a text, write text between <abbr> and </abbr> tag.
- Marked tag: <mark>
 - content written between <mark> and </mark> tag will show as yellow mark on browser
- Strong tag:
 - tag is used to display the important text of the content
- Emphasized tag :
 - tag is used to emphasize the text, and displayed the text in italic form
- Definition tag: <dfn>
 - <dfn> and </dfn> tags, it allow to specify the keyword of the content
- Quoting tag: <blockquote>
 - <blockquote> element shows that the enclosed content is quoted from another source. The Source URL can be given using the cite attribute, and text representation of source can display using <cite> </cite> element.
- Short quote tag : <q>
 - If you will put any content between <q> </q>, then it will enclose the text in double quotes.
- Code tag: <code>
 - <code> </code> element is used to display the part of computer code.
- Keyboard tag: <kbd>
 - <kbd>, indicates that a section of content is a user input from keyboard.
- Address tag: <address>
 - <address> tag defines the contact information about the author of the content.

HTML Anchor

- **HTML anchor tag** defines a *hyperlink that links one page to another page*
- "href" attribute is the most important attribute of the HTML a tag
- href attribute is used to define the address of the file to be linked
- Link Text
- If we want to open that link to another page then we can use target attribute of <a> tag
- If we use target="_blank" then the link will open in other tab

- **target** attribute can only use with href attribute in anchor tag.
- **unvisited link** is displayed underlined and blue
- **visited link** displayed underlined and purple.
- **active link** is underlined and red.

HTML Image

- **HTML img tag** is used to display image on the web page. HTML img tag is an empty tag that contains attributes only, closing tags are not used in HTML image element.
 - **ATTRIBUTES OF HTML IMAGE TAGS**
 - src: source or path of the image
 - alt: alternate text for the image, if it can't be displayed
 - width: specify the width to display the image
 - height:
-

HTML Table

- We can create a table to display data in tabular form, using <table> element, with the help of <tr>(table row) , <td>(table data), and <th>(table header) elements.
- HTML tables are used to manage the layout of the page
- But it is recommended to use div tag over table to manage the layout of the page

HTML Table Tags

Tag	Description
<table>	It defines a table.
<tr>	It defines a row in a table.
<th>	It defines a header cell in a table.
<td>	It defines a cell in a table.
<caption>	It defines the table caption.
<colgroup>	It specifies a group of one or more columns in a table for formatting.

<code><col></code>	It is used with <code><colgroup></code> element to specify column properties for each column.
<code><tbody></code>	It is used to group the body content in a table.
<code><thead></code>	It is used to group the header content in a table.
<code><tfooter></code>	It is used to group the footer content in a table.

HTML Border attribute

- `<!DOCTYPE>`
- `<html>`
- `<body>`
- `<table border="1" style="border-collapse: collapse">`
- `<tr><th>First_Name</th><th>Last_Name</th><th>Marks</th></tr>`
- `<tr><td>Sonoo</td><td>Jaiswal</td><td>60</td></tr>`
- `<tr><td>James</td><td>William</td><td>80</td></tr>`
- `<tr><td>Swati</td><td>Sironi</td><td>82</td></tr>`
- `<tr><td>Chetna</td><td>Singh</td><td>72</td></tr>`
- `</table>`
- `</body>`
- `</html>`

CSS Border property

- `<!DOCTYPE>`
- `<html>`
- `<head>`
- `<style>`
- `table{`
- `border-collapse: collapse;`
- `width: 100%;`
- `}`
- `table, th, td {`
- `border: 1px solid black;`

- border-collapse: collapse;
- }
- th, td {
- padding: 10px;
- }
- table#alter tr:nth-child(even) {
- background-color: #eee;
- }
- table#alter tr:nth-child(odd) {
- background-color: #fff;
- }
- table#alter th {
- color: white;
- background-color: gray;
- }
- </style>
- </head>
- <body>
- <table id="alter">
- <thead>
- <tr><th>First_Name</th><th>Last_Name</th><th>Marks</th></tr>
- </thead>
- <tfoot>
- <tr>
- <th>Total</th>
- <th>90</th>
- <th>4175</th>
- </tr>
- </tfoot>
-
- <tbody>
- <tr><td>Sonoo</td><td>Jaiswal</td><td>60</td></tr>
- <tr><td>James</td><td>William</td><td>80</td></tr>
- <tr><td>Swati</td><td>Sironi</td><td>82</td></tr>
- <tr><td>Chetna</td><td>Singh</td><td>72</td></tr>
- </tbody>
- </table>
- </body>
- </html>

HTML Table with colspan

- If you want to make a cell span more than one column, you can use the colspan attribute.

- `<!DOCTYPE>`
- `<html>`
- `<head>`
- `<style>`
- `table, th, td {`
- `border: 1px solid black;`
- `border-collapse: collapse;`
- `}`
- `th, td {`
- `padding: 5px;`
- `text-align: left;`
- `}`
- `</style>`
- `</head>`
- `<body>`
- `<table style="width:100%">`
- `<tr>`
- `<th>Name</th>`
- `<th colspan="2">Mobile No.</th>`
- `</tr>`
- `<tr>`
- `<td>Ajeet Maurya</td>`
- `<td>7503520801</td>`
- `<td>9555879135</td>`
- `</tr>`
- `</table>`
- `</body>`
- `</html>`

HTML Table with rowspan

- If you want to make a cell span more than one row, you can use the **rowspan** attribute.
- `<!DOCTYPE>`
- `<html>`
- `<head>`
- `<style>`
- `table, th, td {`
- `border: 1px solid black;`
- `border-collapse: collapse;`
- `}`
- `th, td {`
- `padding: 10px;`
- `}`

- `</style>`
- `</head>`
- `<body>`
- `<table>`
- `<caption> Row span example </caption>`
- `<tr><th>Name</th><td>Ajeet Maurya</td></tr>`
- `<tr><th rowspan="2">Mobile No.</th><td>7503520801</td></tr>`
- `<tr><td>9555879135</td></tr>`
- `</table>`
- `</body>`
- `</html>`

HTML `<tbody>` tag

- `<tbody>` tag is used to group the table rows (`<tr>`) together
- `<tbody>` tag must be a child of `<table>` element
- **`<tbody>`.....`</tbody>`**

HTML `<td>` tag

- `<td>` tag is used to specify the cells of an HTML table which contain data of the table
- **`<td>`.....`</td>`**

HTML Textarea

- multi-line text input control
- unlimited number of characters and the texts are displayed in a fixed-width font
- size of the HTML textarea is defined by `<cols>` and `<rows>` attribute, or it can also be defined through CSS height and width properties

HTML `<thead>` tag

- `<thead>` elements is used to define header of an HTML table

HTML Time Tag

- **HTML `<time>` tag** is used to define date and time. It displays time value in a 24 hour clock
- used to encode dates and times in a machine-readable way
- **`<time>`Define Time and Date here`</time>`**
- There is only one specific attribute of HTML5 time tag that is `datetime`

HTML Title

- **HTML title tag** is used *to provide a title name for your webpage*. It is necessary for Search Engine Optimization (SEO).
- title tag must be used inside the <head> tag

HTML <tr> tag

- <tr> tag is used to define the rows in the table
- <tr> tag can consist one or more <th> head cells and <td> data cells to define a single row of HTML table
- <tr> tag must be a direct child of <table> element or it can be nested child of <thead>, <tbody>, and <tfoot> elements
- **<tr>.....</tr>**

HTML <track> tag

- <track> tag is used to define time-based text tracks for a media file.
- <track> tag must use as child element of <audio> and <video> elements.
- <track> tag is used to add subtitle, caption, or any other form of text which displayed when a media file plays.
- **<track src=" " kind=" " srclang=" " label=" ">**

How to create WEBVTT file:

-
- First open the notepad and follow the following image first line is fixed for everything and in second line it is the duration of the subtitle and in the third line it is the subtitles which it will displays this is the format to create WEBVTT file

HTML <tt> tag

- HTML <tt> tag was used to define text in monospaced font or fixed-width fonts

HTML <u> tag

- used to define a span of inline text with a non-textual annotation.

The use of <u> tag should be ignored as it may generate confusion for a hyperlinked text.

HTML Unordered List

- displays elements in bulleted format
- HTML ul tag is used for the unordered list. There can be 4 types of bulleted list
 - disc
 - circle
 - square
 - none

Note: The type attribute is not supported in HTML5, instead of type you can use CSS property of list-style-type. Following is the example to show the CSS property for ul tag.

HTML <var> tag

- <var> tag is a phrase tag which is used to define the variable for a mathematical equation, or in the programming context.
- `<var>.....</var>`

HTML Video Tag

- video tag is used for streaming video files such as a movie clip, song clip on the web page.
- three video formats supported for HTML video tag:
 - mp4
 - webM
 - ogg
- mp4 is supported by every browser

HTML Lists

- Lists are used to specify lists of information
- There are three different types of HTML lists:
 - Ordered List or Numbered List (ol)

- Unordered List or Bulleted List (ul)
- Description List or Definition List (dl)

HTML Ordered List

- the ordered HTML lists, all the list items are marked with numbers by default.

HTML Unordered List

- HTML Unordered list, all the list items are marked with bullets

HTML Description List or Definition List

- definition list is very appropriate when you want to present glossary, list of terms or other name-value list.

HTML Nested List

- list within another list is termed as nested list

HTML Ordered List

- displays elements in numbered format
- There can be different types of numbered list:
 - Numeric Number (1, 2, 3) (Type "1")
 - Capital Roman Number (I II III) (Type "I")
 - Small Roman Number (i ii iii) (Type "i")
 - Capital Alphabet (A B C) (Type "A")
 - Small Alphabet (a b c) (Type "a")
- There is start attribute in ordered list
 - <ol type="A" start="5"> : It will show capital alphabets starting with "E".

HTML Form

- **HTML form** is a section of a document which contains controls such as text fields, password fields, checkboxes, radio buttons, submit button, menus etc.
- HTML form facilitates the user to enter data that is to be sent to the server for processing
- HTML forms are required if you want to collect some data from of the site visitor.
- `<form action="server url" method="get|post">`
- `//input controls e.g. textfield, textarea, radiobutton, button`
- `</form>`

HTML Form Tags

Tag	Description
<form>	It defines an HTML form to enter inputs by the user side.
<input>	It defines an input control.
<textarea>	It defines a multi-line input control.
<label>	It defines a label for an input element.
<fieldset>	It groups the related elements in a form.
<legend>	It defines a caption for a <fieldset> element.
<select>	It defines a drop-down list.
<optgroup>	It defines a group of related options in a drop-down list.
<option>	It defines an option in a drop-down list.
<button>	It defines a clickable button.

The <form> element does not itself create a form but it is a container to contain all required form elements, such as <input>, <label>, etc.

- <body>
- <form>
- <fieldset>
- <legend>User Information:</legend>
-
- Enter your name
 <input type="text" name="username">
- First Name: <input type="text" name="firstname"/>

- Last Name: <input type="text" name="lastname"/>

- Enter your address:
 <textarea rows="2" cols="20"></textarea>

-
- `<label for="firstname">First Name: </label>
`
- `<input type="text" id="firstname" name="firstname"/>
`
-
- `<label for="password">Password: </label>`
- `<input type="password" id="password" name="password"/>
`
-
- `<label for="email">Email: </label>`
- `<input type="email" id="email" name="email"/>
`
- `<label for="gender">Gender: </label>`
- `<input type="radio" id="gender" name="gender" value="male"/>Male
`
- `<input type="radio" id="gender" name="gender" value="female"/>Female`
- `
`
-
- Hobby:

- `<input type="checkbox" id="cricket" name="cricket" value="cricket"/>`
- `<label for="cricket">Cricket</label>
`
- `<input type="checkbox" id="football" name="football" value="football"/>`
- `<label for="football">Football</label>
`
- `<input type="checkbox" id="hockey" name="hockey" value="hockey"/>`
- `<label for="hockey">Hockey</label>`
- `<input type="submit" value="submit">`
- `<input type="datetime-local" name="meetingdate">
`
-
- `</form>`
- `</body>`
- name attribute is optional, but it is required for the server side component such as JSP, ASP, PHP etc.

If you will omit 'name' attribute then the text filed input will not be submitted to server.

HTML <fieldset> element:

- <fieldset> element in HTML is used to group the related information of a form. This element is used with <legend> element which provide caption for the grouped elements.

HTML Form Example

- <!DOCTYPE html>

- `<html>`
- `<head>`
- `<title>`Form in HTML`</title>`
- `</head>`
- `<body>`
- `<h2>`Registration form`</h2>`
- `<form>`
- `<fieldset>`
- `<legend>`User personal information`</legend>`
- `<label>`Enter your full name`</label>
`
- `<input type="text" name="name">
`
- `<label>`Enter your email`</label>
`
- `<input type="email" name="email">
`
- `<label>`Enter your password`</label>
`
- `<input type="password" name="pass">
`
- `<label>`confirm your password`</label>
`
- `<input type="password" name="pass">
`
- `
<label>`Enter your gender`</label>
`
- `<input type="radio" id="gender" name="gender" value="male"/>`Male `
`
- `<input type="radio" id="gender" name="gender" value="female"/>`Female `
`
- `<input type="radio" id="gender" name="gender" value="others"/>`others `
`
- `
`Enter your Address:`
`
- `<textarea></textarea>
`
- `<input type="submit" value="sign-up">`
- `</fieldset>`
- `</form>`
- `</body>`
- `</html>`

HTML Form Input Types

- `<input type=" ">`

Following is a list of all types of `<input>` element of HTML

text	Defines a one-line text input field
password	Defines a one-line password input field
submit	Defines a submit button to submit the form to server

reset	Defines a reset button to reset all values in the form.
radio	Defines a radio button which allows select one option.
checkbox	Defines checkboxes which allow select multiple options form.
button	Defines a simple push button, which can be programmed to perform a task on an event.
file	Defines to select the file from device storage.
image	Defines a graphical submit button.

<input type="text">

- <input> element of type "text" are used to define a single-line input text field.
- **<form action="https://www.facebook.com/" method="post" target="_blank" enctype="application/x-www-form-urlencoded ">**
- **<label>Enter first name</label>
**
- **<input type="text" name="firstname" value="firstname" size="40" autofocus>
**
- **<label>Enter last name</label>
**
- **<input type="text" name="lastname" value="lastname">
**
- **<label>Enter Password</label>
**
- **<input type="Password" name="password" value="password">
**
- **
<input type="submit" value="submit">**
- **
<input type="reset" value="Reset">**
- **<p>Note:The default maximum cahracter lenght is 20.</p>**
- **<p>Kindly Select your favorite color</p>**
- **<input type="radio" name="color" value="red"> Red
**
- **<input type="radio" name="color" value="blue"> blue
**
- **<input type="radio" name="color" value="green">green
**
- **<input type="radio" name="color" value="pink">pink
**
- **<input type="submit" value="submit">**
- **<p>Kindly Select your favourite sports</p>**
- **<input type="checkbox" name="sport1" value="cricket">Cricket
**
- **<input type="checkbox" name="sport2" value="tennis">Tennis
**
- **<input type="checkbox" name="sport3" value="football">Football
**
- **<input type="checkbox" name="sport4" value="baseball">Baseball
**
- **<input type="checkbox" name="sport5" value="badminton">Badminton

**
- **<input type="submit" value="submit">**
- **<input type="button" value="Click me" onclick="alert('you are learning HTML')">**
- **<label>Select file to upload:</label>**

- `<input type="file" name="newfile">`
- `<input type="submit" value="submit">`
- `<input type="image" alt="Submit" src="login.png" width="100px">`
- `<input type="color" name="downclick" value="#f5f5dc">` Downclick `
`
- `<input type="date" name="Startdate">` Start date: `

`
- `<input type="datetime-local" name="meetingdate">`
- `<input type="email" name="email" required>`
- `<input type="email" name="email" multiple>`
- `<input type="month" name="newMonth">`
- `<input type="number" name="num" min="50" max="80">`
- `<input type="url" name="website" placeholder="http://example.com">
`
- `<input type="week" name="bestweek">`
- `<input type="search" name="q">`
- `<input type="tel" name="telephone" pattern="[0-9]{3}-[0-9]{3}-[0-9]{4}" required>`
- `<input type="text" name="uname" disabled>

`
- `</form>`

`<input type="password">`:

- The entered text in password field converted into "*" or ".", so that it cannot be read by another user.

`<input type="submit">`:

- `<input>` element of type "submit" defines a submit button to submit the form to the server when the "click" event occurs
- After clicking on submit button, this will submit the form to server and will redirect the page to **action** value.

`<input type="reset">`:

- `<input>` type "reset" is also defined as a button but when the user performs a click event, it by default reset the all inputted values.

`<input type="radio">`:

- only one radio button option can be selected at a time.

`<input type="checkbox">`:

- `<input>` type "checkbox" are displayed as square boxes which can be checked or unchecked to select the choices from the given options

radio buttons allow the user to select only one option at a time, whereas checkbox allows a user to select zero to multiple options at a time

<input type="button">:

- <input> type "button" defines a simple push button, which can be programmed to control a functionality on any event such as, click event.

It mainly works with JavaScript.

<input type="file">:

- <input> element with type "file" is used to select one or more files from user device storage. Once you select the file, and after submission, this file can be uploaded to the server with the help of JS code and file API.

<input type="image">

- <input> type "image" is used to represent a submit button in the form of image.

<input type="color">:

- default value of "color" type is #000000 (black). It only supports color value in hexadecimal format

"color" type only supports color value in hexadecimal format, <input> type "color" is used to define an input field which contains a colour

<input type="date">:

- <input> element of type "date" generates an input field, which allows a user to input the date in a given format
- user can enter the date by text field or by date picker interface.

<input type="datetime-local">:

- <input> element of type "datetime-local" creates input field which allow a user to select the date as well as local time in the hour and minute without time zone information.

<input type="email">

- <input> type "email" creates an input field which allows a user to enter the e-mail address with pattern validation. The multiple attributes allow a user to enter more than one email address.

<input type="month">:

- creates an input field which allows a user to easily enter month and year in the format

<input type="number">:

- The <input> element type number creates an input field which allows a user to enter the numeric value. You can also restrict to enter a minimum and maximum value using min and max attribute.
- It will allow to enter number in range of 50-80. If you want to enter number other than range, it will show an error.

<input type="url">:

- <input> element of type "url" creates an input field which enables user to enter the URL

<input type="week">:

- <input> type week creates an input field which allows a user to select a week and year form

<input type="tel">:

- <input> element of type "tel" creates an input field to enter the telephone number
- "tel" type does not have default validation such as email

HTML form Attribute

action attribute

- defines the process to be performed on form when form is submitted
- It can be .php, .jsp, .asp, etc. or any URL where you want to process your form.

method attribute

- defines the HTTP method which browser used to submit the form
- possible values of method attribute can be
 - **post:** when we want to process the sensitive data as it does not display the submitted data in URL
 - **get:** default value while submitting the form. But this is not secure as it displays data in URL after submitting the form.

target attribute

- target attribute defines where to open the response after submitting the form
- following are the keywords used with the target attribute
 - **_self:** then the response will display in current page only.
 - **_blank:** load the response in a new page.

enctype attribute

- enctype attribute defines the encoding type of form-content while submitting the form to the server.
- possible values of enctype can be:
 - **application/x-www-form-urlencoded:**
 - default encoding type
 - All characters are encoded before submitting the form.
 - **multipart/form-data:**
 - does not encode any character
 - used when our form contains file-upload controls.
 - **text/plain (HTML5):**
 - In this encoding type only space are encoded into + symbol and no any other special character encoded.

HTML <input> element attribute

HTML name attribute

One should not omit the name attribute as when we submit the form the HTTP request includes both name-value pair and if name is not available it will not process that input field.

HTML value attribute

- default value of an input field

HTML required attribute

- HTML required is a Boolean attribute which specifies that user must fill that field before submitting the form

HTML autofocus attribute

- autofocus is a Boolean attribute which enables a field automatically focused when a webpage loads.

HTML placeholder attribute

- When the user enters the value, the placeholder will be automatically removed.

- placeholder attribute can be used with text, password, email, and URL values.

HTML disabled attribute

- disable that input field.
- does not allow the user to interact with that field.
- does not receive click events, and these input value will not be sent to the server when submitting the form.

HTML size attribute

- controls the size of the input field in typed characters.

HTML form attribute

- form attribute allows a user to specify an input field outside the form but remains the part of the parent form.

HTML style using CSS

- `<!DOCTYPE html>`
- `<html>`
- `<head>`
- `<title></title>`
- `<link rel="stylesheet" type="text/css" href="style.css">`
- `<style>`
- `/*Internal CSS using element name*/`
- `body{background-color:lavender;`
- `text-align: center;}`
- `h2{font-style: italic;`
- `font-size: 30px;`
- `color: #f08080;}`
- `p{font-size: 20px;}`
- `/*Internal CSS using class name*/`
- `.blue{color: blue;}`
- `.red{color: red;}`
- `.green{color: green;}`
- `#myid {`
- `background-color: lightpink;`
- `color: black;`
- `padding: 40px;`
- `text-align: center;`
- `}`
- `</style>`
- `</head>`
- `<body style="text-align: center;">`

- `<h1 id="myid">Example of HTML id</h1>`
- `<h2 style="color: red;">Welcome to HTML</h2>`
- `<h3 style="color: red;font-style: italic; text-align: center;font-size: 50px; padding-top: 25px;">Learning HTML using Inline CSS</h3>`
- `<p class="red blue">This is a red color paragraph</p>`
- `<p style="color: blue; font-size: 25px; font-style: italic ;">This is a great website to learn technologies in very simple way. </p>`
- `</body>`
- `</html>`
- we have used a style attribute to provide some styling format to our code.
- Each property in CSS has a name-value pair, and each property is separated by a semicolon (;).

Example CSS File

- ```
body{
 background-color:lavender;
 text-align: center;
}
h2{
 font-style: italic;
 size: 30px;
 color: #f08080;
}
p{
 font-size: 20px;
}

.blue{
 color: blue;
}
.red{
 color: red;
}
.green{
 color: green;
}
```

## Three ways to apply CSS

- **Inline CSS:** using style attribute in the HTML elements.
  - It can apply style uniquely in each element.
  - We can use as many properties as we want, but each property should be separated by a semicolon (;).
- **Internal or Embedded CSS:** using `<style>` tag in `<head>` section.

- can use internal CSS to apply a style for a single HTML page
- **External CSS:** Define all CSS property in a separate .css file, and then include the file with HTML file using tag in section.
  - contains style code using the class name, id name, tag name, etc
  - We can use this CSS file in any HTML file by including it in HTML file using <link> tag.

## Commonly used CSS properties:

| Properties-name  | Syntax                        | Description                                             |
|------------------|-------------------------------|---------------------------------------------------------|
| background-color | background-color:red;         | It defines the background color of that element.        |
| color            | color: lightgreen;            | It defines the color of text of an element              |
| padding          | padding: 20px;                | It defines the space between content and the border.    |
| margin           | margin: 30px;<br>margin-left: | It creates space around an element.                     |
| font-family      | font-family: cursive;         | Font-family defines a font for a particular element.    |
| Font-size        | font-size: 50px;              | Font-size defines a font size for a particular element. |
| text-align       | text-align: left;             | It is used to align the text in                         |

|  |  |                      |
|--|--|----------------------|
|  |  | a selected position. |
|--|--|----------------------|

## Class Attribute in HTML

- class name can be used by CSS and JavaScript to do some tasks for HTML elements.
- class attribute can be defined within <style> tag or in separate file using the (.) character.

*class name is case-sensitive*

- can use multiple class names (more than one) with HTML elements. These class names must be separated by a space.

## HTML id with CSS

- In CSS, if you want to select an element with a specific id, write a hash (#) character, followed by the id of the element.
- HTML class name can be used by multiple elements while An HTML element can only have one unique id that belongs to that single element

## HTML id with JavaScript

- <!DOCTYPE html>
- <html>
- <head>
- <style>
- #myid{
- color:blue;
- }
- </style>
- </head>
- <body>
- <h2>HTML id with JavaScript</h2>
- <h1 id="myid">Hello User</h1>
- <button onclick="displayResult()">Change text</button>
- <script>
- function displayResult() {
- document.getElementById("myid").innerHTML = "All the best for future!";
- }
- </script>
- </body>

➤ </html>

## HTML iframes

- display a nested webpage
- hence it is also called as an Inline frame.
- <iframe src="URL"></iframe>
- You can also change the size, color, style of the iframe's border.

## Iframe Target for a link

- Your specified target attribute of the link must refer to the name attribute of the iframe.

## Attributes of <iframe>

| Attribute name  | Value        | Description                                                                                                 |
|-----------------|--------------|-------------------------------------------------------------------------------------------------------------|
| allowfullscreen |              | If true then that frame can be opened in full screen.                                                       |
| height          | Pixels       | It defines the height of the embedded iframe, and the default height is 150 px.                             |
| name            | text         | It gives the name to the iframe. The name attribute is important if you want to create a link in one frame. |
| frameborder     | 1 or 0       | It defines whether iframe should have a border or not. (Not supported in HTML5).                            |
| Width           | Pixels       | It defines the width of embedded frame, and default width is 300 px.                                        |
| src             | URL          | The src attribute is used to give the path name or file name which content to be loaded into iframe.        |
| sandbox         |              | This attribute is used to apply extra restrictions for the content of the frame                             |
|                 | allow-forms  | It allows submission of the form if this keyword is not used then form submission is blocked.               |
|                 | allow-popups | It will enable popups, and if not applied then no popup will                                                |

|           |                   |                                                                                                                                     |
|-----------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------|
|           |                   | open.                                                                                                                               |
|           | allow-scripts     | It will enable the script to run.                                                                                                   |
|           | allow-same-origin | If this keyword is used then the embedded resource will be treated as downloaded from the same source.                              |
| srcdoc    |                   | The srcdoc attribute is used to show the HTML content in the inline iframe. It overrides the src attribute (if a browser supports). |
| scrolling |                   | It indicates that browser should provide a scroll bar for the iframe or not. (Not supported in HTML5)                               |
|           | auto              | Scrollbar only shows if the content of iframe is larger than its dimensions.                                                        |
|           | yes               | Always shows scroll bar for the iframe.                                                                                             |
|           | no                | Never shows scrollbar for the iframe.                                                                                               |

## HTML JavaScript

- most popular scripting language is JavaScript used for websites.
- Script is a small program which is used with HTML to make web pages more attractive, dynamic and interactive
- `<!DOCTYPE html>`
- `<html>`
- `<body>`
- `<input type="button" value="Click" onclick="alert('Hi, how are you')">`
- `<button type="button" onclick="document.getElementById('demo').innerHTML = Date()>`
- Click me to display Date and Time.</button>
- `<p id="demo"></p>`
- `<script>`
- `document.getElementById("demo").innerHTML = "Hello User";`
- `</script>`
- `</body>`
- `</html>`

## HTML <script> Tag

- used to specify a client-side script

- we can place `<script>` tag within `<body>` or `<head>` section.
- mainly used to manipulate images, form validation and change content dynamically

## HTML events with JavaScript

- An event is something which user does, or browser does such as mouse click or page loading are examples of events, and JavaScript comes in the role if we want something to happen on these events.
- `<element event = "JS code">`

| Event Name | Handler Name | Occurs when                                      |
|------------|--------------|--------------------------------------------------|
| onBlur     | blur         | When form input loses focus                      |
| onClick    | click        | When the user clicks on a form element or a link |
| onSubmit   | submit       | When user submits a form to the server.          |
| onLoad     | load         | When page loads in a browser.                    |
| onFocus    | focus        | When user focuses on an input field.             |
| onSelect   | select       | When user selects the form input field.          |

- **1) JavaScript can change HTML content.**
- **2) JavaScript can change HTML style**
- `<!DOCTYPE html>`
- `<html>`
- `<body>`
- `<p>JavaScript can change the content of an HTML element:</p>`
- `<button type="button" onclick="myFunction()">Click Me!</button>`
- `<p id="demo">JavaScript can change the style of an HTML element</p>`
- `<script>`
- `function myFunction() {`
- `document.getElementById("demo").innerHTML = "Hello User";`

- document.getElementById("demo").style.fontSize = "25px";
- document.getElementById("demo").style.color = "brown";
- document.getElementById("demo").style.backgroundColor = "lightgreen";
- 
- }
- </script>
- </body>
- </html>
- **3) JavaScript can change HTML attributes.**
- <html>
- <body>
- <script>
- function light(sw) {
- var pic;
- if (sw == 0) {
- pic = "pic\_lightoff.png"
- } else {
- pic = "pic\_lighton.png"
- }
- document.getElementById('myImage').src = pic;
- }
- </script>
- 
- <p>
- <button type="button" onclick="light(1)">Light On</button>
- <button type="button" onclick="light(0)">Light Off</button>
- </p>
- </body>
- </html>

## Use External Script

- Save JavaScript external files using .js extension.
- <script type="text/javascript" src="URL "></script>
- **HTML CODE:**
- <!DOCTYPE html>
- <html>
- <head>
- <script type="text/javascript" src="external.js"></script>
- </head>
- <body>
- <h2>External JavaScript Example</h2>
- <form onsubmit="fun()">
- <label>Enter your name:</label><br>

- <input type="text" name="uname" id="frm1"><br>
- <label>Enter your Email-address:</label><br>
- <input type="email" name="email"><br>
- <input type="submit">
- </form>
- <noscript>This text is not visible in the browser.</noscript>
- </body>
- </html>
- **JavaScript code:**
- function fun() {
- var x = document.getElementById("frm1").value;
- alert("Hi"+" "+x+ "you have successfully submitted the details");
- }

## HTML <noscript> Tag

- The text written within <noscript></noscript> tag is not displayed on the browser.

## HTML Comments

- comments will not be visible on the webpage.
- <!-- Write commented text here -->

## Absolute File Paths

- specifies full URL address.

## Relative File Paths

- specifies to a file which is related to the location of current page
- prefer to use independent file paths

## HTML Head

- container for metadata (data about data).
- whose content is not displayed in the browser on page loading. It just contains metadata about the HTML document
- Metadata defines the document title, character set, styles, links, scripts, and other meta information.

## HTML <title> Element

- define the title of the document
- <title> element must be placed between <head> element

*recommended length is 65 to 70 characters including spaces.*

## HTML <style> Element

- used to style the HTML page

## HTML <link> Element

- <link> element is used to link an external style sheet to your webpage
- <link rel="stylesheet" href="style.css">

## HTML <meta> Element

- specify the character set, page description, keywords, authors and other metadata on the webpage.
- <meta charset="UTF-8">
- "UTF-8" which means it can handle to display any language.
- This will be in head tag
- <meta name="description" content="Free Web tutorials">
- If you give a meta description then it will be useful for the relevant search to perform by search engines.
- <meta name="keywords" content="HTML, CSS, XML, JavaScript">
- keyword value is also used to provide keywords for a search engine
- <meta name="author" content="Akon">
- specifies the name of the person who wrote the page content
- <meta http-equiv="refresh" content="30">
- <meta http-equiv="refresh" content="10; url= <https://www.facebook.com/>>
- The above is auto refresh method
- <meta name="viewport" content="width=device-width, initial-scale=1.0">

## HTML <base> Element

- <base> element is used to specify the base URL and base target for all relative URLs in a page.
- <base href=" <https://www.facebook.com/>" target="\_blank">
- <!DOCTYPE html>
- <html>
- <head>
- <meta charset="UTF-8">
- <meta name="description" content="Free Web tutorials">
- <meta name="keywords" content="HTML,CSS,XML,JavaScript">

- `<meta name="author" content="Akon">`
- `</head>`
- `<body>`
- `<p>All the meta information are set.</p>`
- `</body>`
- `</html>`

## HTML Layouts

- HTML layouts provide a way to arrange web pages in well-mannered, well-structured, and in responsive form

- 
- Every website has a specific layout to display content in a specific manner.

*HTML layouts create an individual space for every part of the web page. So that every element can arrange in a significant order.*

## Description of various Layout elements

### HTML `<header>`

- `<header>` element is used to create header section of web pages. The header contains the introductory content, heading element, logo or icon for the webpage, and authorship information.

## HTML <nav>

- <nav> elements is a container for the main block of navigation links. It can contain links for the same page or for other pages.

## HTML <section>

- <section> elements represent a separate section of a web page which contains related element grouped together. It can contain: text, images, tables, videos, etc.

## HTML <article>

- tag is used to contain a self-contained article such as big story, huge article, etc.

## HTML <aside>

- HTML <aside> define aside content related to primary content. The <aside> content must be related to the primary content. It can function as side bar for the main content of web page.

## HTML <footer>

- HTML <footer> element defines the footer for that document or web page. It mostly contains information about author, copyright, other links, etc.

## HTML <details>

- HTML <details> element is used to add extra details about the web page and use can hide or show the details as per requirement.

## HTML Sample WebPage

- <html>
- <head>
- <title>First Webpage</title>
- <style>
- li{ display: inline-block;
- padding: 10px;
- 
- text-align: center;
- }

## CSS Frameworks

- To get a proper layouts we no need to write the whole codes again and again we can use boot strap for that it is a open source platform
- These are the following bootstrap links you can use
- <https://www.w3schools.com/bootstrap4/default.asp>
- <https://www.w3schools.com/bootstrap/default.asp>
- <https://www.tutorialrepublic.com/twitter-bootstrap-tutorial/>
- <https://www.tutorialspoint.com/bootstrap/index.htm>
- <https://www.javatpoint.com/bootstrap-tutorial>
- <https://websitesetup.org/bootstrap-tutorial-for-beginners/>
- <https://bootstrapious.com/tutorials>

## HTML Responsive

1. <!DOCTYPE html>
2. <html>
3. <meta name="viewport" content="width=device-width, initial-scale=1.0">

4. <body>
5. <h2>Responsive Image</h2>
6. <p>"max-width:100%" makes the image responsive and also ensures that the image
7. doesn't get bigger than its original size.</p>
8. <p>Resize the browser window to see the effect.</p>
9.  (Change the image)
- 10.</body>
- 11.</html>

## HTML Entities

- if you use less than (<) or greater than (>) symbols in your text, the browser can mix them with tags that's why character entities are used in HTML to display reserved characters.
- Each entity starts with symbol ampersand (&) and ends with a semicolon (;).

| Result | Description                        | Entity Name | Entity Number |
|--------|------------------------------------|-------------|---------------|
|        | non-breaking space                 | &nbsp;      | 160           |
| <      | less than                          | &lt;        | 60            |
| >      | greater than                       | &gt;        | 62            |
| &      | ampersand                          | &amp;       | 38            |
| "      | double quotation mark              | &quot;      | 34            |
| '      | single quotation mark (apostrophe) | &apos;      | 39            |
| ¢      | cent                               | &cent;      | 162           |
| £      | pound                              | &pound;     | 163           |
| ¥      | yen                                | &yen;       | 165           |
| €      | Euro                               | &euro;      | 8364          |
| ©      | copyright                          | &copy;      | 169           |

|--|-----------|--|--|
|  | trademark |  |  |
|--|-----------|--|--|

*Entity names are case sensitive*

## Diacritical Marks in HTML

- some special types of letters used in HTML which have some glyph added to the top or below the letters. These glyphs are called diacritical mark.
- like grave ( ` ) and acute ( ´ ) are called accents

| Mark | Character | Construct | Result |
|------|-----------|-----------|--------|
| `    | a         | a&#768;   | à      |
| ´    | a         | a&#769;   | á      |
| ^    | a         | a&#770;   | â      |
| ~    | a         | a&#771;   | ã      |
| `    | O         | O&#768;   | Ò      |
| ´    | O         | O&#769;   | Ó      |
| ^    | O         | O&#770;   | Ô      |
| ~    | O         | O&#771;   | Õ      |

## HTML Symbols

- many mathematical, technical and currency symbols which are not present on a normal keyboard. We have to use HTML entity names to add such symbols to an HTML page.

## Mathematical Symbols Supported by HTML

| Char | Number  | Entity   | Description |
|------|---------|----------|-------------|
| ∀    | &#8704; | &forall; | FOR ALL     |

|             |         |         |                         |
|-------------|---------|---------|-------------------------|
| $\partial$  | &#8706; | &part;  | PARTIAL<br>DIFFERENTIAL |
| $\exists$   | &#8707; | &exist; | THERE EXISTS            |
| $\emptyset$ | &#8709; | &empty; | EMPTY SETS              |
| $\nabla$    | &#8711; | &nabla; | NABLA                   |
| $\in$       | &#8712; | &isin;  | ELEMENT OF              |
| $\notin$    | &#8713; | &notin; | NOT AN ELEMENT<br>OF    |
| $\ni$       | &#8715; | &ni;    | CONTAINS AS<br>MEMBER   |
| $\prod$     | &#8719; | &prod;  | N-ARY PRODUCT           |
| $\sum$      | &#8721; | &sum;   | N-ARY<br>SUMMATION      |

## Greek Symbols Supported by HTML

| Char | Number | Entity  | Description                   |
|------|--------|---------|-------------------------------|
| A    | &#913; | &Alpha; | GREEK CAPITAL<br>LETTER ALPHA |
| B    | &#914; | &Beta;  | GREEK CAPITAL<br>LETTER BETA  |
| Γ    | &#915; | &Gamma; | GREEK CAPITAL                 |

|   |        |           |                              |
|---|--------|-----------|------------------------------|
|   |        |           | LETTER GAMMA                 |
| Δ | &#916; | &Delta;   | GREEK CAPITAL LETTER DELTA   |
| Ε | &#917; | &Epsilon; | GREEK CAPITAL LETTER EPSILON |
| Ζ | &#918; | &Zeta;    | GREEK CAPITAL LETTER ZETA    |

## Some Important Symbols Supported by HTML

| Char | Number  | Entity  | Description      |
|------|---------|---------|------------------|
| ©    | &#169;  | &copy;  | COPYRIGHT SIGN   |
| ®    | &#174;  | &reg;   | REGISTERED SIGN  |
| €    | &#8364; | &euro;  | EURO SIGN        |
| ™    | &#8482; | &trade; | TRADEMARK        |
| ←    | &#8592; | &larr;  | LEFTWARDS ARROW  |
| ↑    | &#8593; | &uarr;  | UPWARDS ARROW    |
| →    | &#8594; | &rarr;  | RIGHTWARDS ARROW |

|   |         |          |                       |
|---|---------|----------|-----------------------|
| ↓ | &#8595; | &darr;   | DOWNWARDS<br>ARROW    |
| ♠ | &#9824; | &spades; | BLACK SPADE<br>SUIT   |
| ♣ | &#9827; | &clubs;  | BLACK CLUB SUIT       |
| ♥ | &#9829; | &hearts; | BLACK HEART<br>SUIT   |
| ♦ | &#9830; | &diams;  | BLACK DIAMOND<br>SUIT |

## HTML Charset

- HTML Character Sets or HTML Encoding
- <meta charset="UTF-8">
- ASCII stands for American Standard Code for Information Interchange.
- ASCII provides 128 different alphanumeric characters that could be used on the internet: numbers (0-9), English letters (A-Z), and some special characters like! \$ + - ( ) @ < > .

## ASCII Character Set

## ANSI Character Set

## ISO-8859-1 Character Set

## UTF-8 Character Set

---

## HTML URL Encode

- URL stands for Uniform Resource Locator.
- scheme://prefix.domain:port/path/filename
  - **scheme** is used to define the type of Internet service (most common is http or https).
  - **prefix** is used to define a domain prefix (default for http is www).

- **domain** is used to define the Internet domain name (like User.com).
- **port** is used to define the port number at the host (default for http is 80).
- **path** is used to define a path at the server (If omitted: the root directory of the site).
- **filename** is used to define the name of a document or resource.

**Following is a list of some common types of schemes used in URL:**

- http(HyperText Transfer Protocol):Common web pages. Not encrypted.
  - https (Secure HyperText Transfer Protocol):Secure web pages. Encrypted.
  - ftp(File Transfer Protocol): Downloading or uploading files.
  - file: A file on your computer.
- URLs cannot contain spaces. URL encoding normally replaces a space with a plus (+) sign, or %20

| Character | From Windows-1252 | From UTF-8 |
|-----------|-------------------|------------|
| €         | %80               | %E2%82%AC  |
| £         | %A3               | %C2%A3     |
| ©         | %A9               | %C2%A9     |
| ®         | %AE               | %C2%AE     |
| À         | %C0               | %C3%80     |
| Á         | %C1               | %C3%81     |
| Â         | %C2               | %C3%82     |
| Ã         | %C3               | %C3%83     |
| Ä         | %C4               | %C3%84     |
| Å         | %C5               | %C3%85     |

## Global Attributes

- attributes which are common for all HTML elements.
- supported by both standard and non-standard element.
- Following is the complete list of global attributes with their description:

| Attributes | value     | Description            |
|------------|-----------|------------------------|
| accesskey  | character | It is used to generate |

|                                                                                                      |               |                                                                                                                         |
|------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------|
|                                                                                                      |               | keyboard shortcuts for the current element.                                                                             |
| class                                                                                                | classname     | It is used to provide the class name for the current element. It is mainly used with the stylesheet.                    |
| Contenteditable<br> | true<br>false | It determines whether the content within an element is editable or not.                                                 |
| contextmenu                                                                                          | menu_id       | It defines the id for the <menu> element which is used as a context menu (a menu appear on right click) for an element. |
| data-*            | somevalue     | It is used to store element-specific private data which can be                                                          |

|                                                                                              |                       |                                                                                                                            |
|----------------------------------------------------------------------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
|                                                                                              |                       | accessed by Javascript.                                                                                                    |
| dir                                                                                          | rtl<br>ltr<br>auto    | It specifies the direction of the content inside the current element.                                                      |
| draggable   | true<br>false<br>auto | It specifies whether the content within an element is movable or not using Drag and Drop API.                              |
| dropzone  | copy<br>move<br>link  | It specifies the action is taken on the dragged element when it is dropped, such as whether it is copied, moved or linked. |
| hidden    |                       | It is used to hide the element from view.                                                                                  |
| id                                                                                           | id                    | It specifies a unique id for the element. It can be                                                                        |

|                                                                                               |               |                                                                                     |
|-----------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------|
|                                                                                               |               | used with CSS and JavaScript.                                                       |
| lang                                                                                          | language_code | It specifies the primary language for the content of an element.                    |
| style                                                                                         | style         | It is used to apply inline CSS to the current element.                              |
| spellcheck   | true<br>false | It specifies whether the content should be checked for spelling errors or not.      |
| tabindex                                                                                      | number        | It determines the tabbing order of an element.                                      |
| title                                                                                         | text          | It is used to provide the title, name, or some extra information about the element. |
| translate  | yes<br>no     | It specifies whether the content of the element                                     |

|  |  |                                                                        |
|--|--|------------------------------------------------------------------------|
|  |  | should be<br>translated<br>when the<br>page is<br>localized or<br>not. |
