PL/SQL Variables and constants, Literals

Saturday, March 19, 2022 6:18 PM

- Block structured Language
- Conditional statements, loops, arrays, string, exceptions, collections, records, triggers, functions, procedures, cursors etc.
- PI/SQL stands for "Procedural Language extension of SQL" that is used in Oracle. PL/SQL is integrated with Oracle database (since version 7).
- PL/SQL includes procedural language elements like conditions and loops. It allows declaration of constants and variables, procedures and functions, types and variable of those types and triggers. It can support Array and handle exceptions (runtime errors).
- The PL/SQL is known for its combination of data manipulating power of SQL with data processing power of procedural languages
- The PL/SQL is known for its combination of data manipulating power of SQL with data processing power of procedural languages

Radius Number := 5;

Date_of_birth date;

Declaration Restrictions:

In PL/SQL while declaring the variable some restrictions hold.

 Forward references are not allowed i.e. you must declare a constant or variable before referencing it in another statement even if it is a declarative statement.

val number := Total - 200;

Total number := 1000;

The first declaration is illegal because the TOTAL variable must be declared before using it in an assignment expression.

 Variables belonging to the same datatype cannot be declared in the same statement.

N1, N2, N3 Number;

It is an illegal declaration.

The name of the variable must begin with ASCII letter. The PL/SQL is not case sensitive so it could be either lowercase or uppercase. For example: v_data and V_DATA refer to the same variables.

You should make your variable easy to read and understand, after the first character, it may be any number, underscore (_) or dollar sign (\$).

NOT NULL is an optional specification on the variable.

Every time you declare a variable, PL/SQL defines a default value NULL to it. If you want to initialize a variable with other value than NULL value, you can do so during the declaration, by using any one of the following methods

- The DEFAULT keyword
- The assignment operator

counter binary_integer := 0; greetings varchar2(20) **DEFAULT** 'Hello JavaTpoint';

Example:

```
DECLARE
a integer := 30;
b integer := 40;
c integer;
f real;

BEGIN
c := a + b;
dbms_output.put_line('Value of c: ' || c);
f := 100.0/3.0;
dbms_output.put_line('Value of f: ' || f);

END;
```

After the execution, this will produce the following result:

```
DECLARE
-- Global variables
 num1 number := 95;
 num2 number := 85;
BEGIN
 dbms_output.put_line('Outer Variable num1: ' || num1);
 dbms_output.put_line('Outer Variable num2: ' || num2);
 DECLARE
   -- Local variables
   num1 number := 195;
   num2 number := 185;
 BEGIN
   dbms_output.put_line('Inner Variable num1: ' || num1);
   dbms_output.put_line('Inner Variable num2: ' || num2);
 END;
END;
```

After the execution, this will produce the following result:

```
Outer Variable num1: 95
Outer Variable num2: 85
Inner Variable num1: 195
Inner Variable num2: 185
PL/SQL procedure successfully completed.
```

Variable Attributes:

• When you declare a PL/SQL variable to hold the column values, it must be of correct data types and precision, otherwise error will occur on execution. Rather than hard coding the data type and precision of a variable. PL/SQL provides the facility to declare a variable without

- having to specify a particular data type using %TYPE and %ROWTYPE attributes
- The %TYPE attribute is used to declare variables according to the already declared variable or database column. It is used when you are declaring an individual variable, not a record. The data type and precision of the variable declared using %TYPE attribute is the same as that of the column that is referred from a given table

```
DECLARE

SALARY EMP.SAL % TYPE;

ECODE EMP.empno % TYPE;

BEGIN

Ecode := &Ecode;

Select SAL into SALARY from EMP where EMPNO = ECODE;

dbms_output.put_line('Salary of ' || ECODE || 'is = || salary');

END;
```

After the execution, this will produce the following result:

```
Enter value for ecode: 7499

Salary of 7499 is = 1600

PL/SQL procedure successfully completed.
```

```
DECLARE

EMPLOYEE EMP. % ROW TYPE;

BEGIN

EMPLOYEE.EMPNO := 2092;

5 EMPLOYEE.ENAME := 'Sanju';

Insert into EMP where (EMPNO, ENAME) Values (employee.empno, employee.ename);

dbms_output.put_line('Row Inserted');

END;
```

After the execution, this will produce the following result:

```
Row Inserted
PL/SQL procedure successfully completed.
```

Advantages:

If you don't know the data type at the time of declaration. The data type assigned to the associated variables will be determined dynamically at run time.

If the data type of the variable you are referencing changes the %TYPE or %ROWTYPE variable changes at run time without having to rewrite variable declarations. For example: if the ENAME column of an EMP table is changed from a VARCHAR2(10) to VRACHAR2(15) then you don't need to modify the PL/SQL code.

PL/SQL Constants

```
DECLARE
 -- constant declaration
 pi constant number := 3.141592654;
 -- other declarations
 radius number(5,2);
 dia number(5,2);
 circumference number(7, 2);
 area number (10, 2);
BEGIN
 -- processing
 radius := 9.5;
 dia := radius * 2;
 circumference := 2.0 * pi * radius;
 area := pi * radius * radius;
 -- output
 dbms_output.put_line('Radius: ' || radius);
 dbms_output.put_line('Diameter: ' || dia);
 dbms_output.put_line('Circumference: ' || circumference);
 dbms_output_line('Area: ' || area);
END;
```

After the execution of the above code at SQL prompt, it will produce the following result:.

```
Radius: 9.5
Diameter: 19
Circumference: 59.69
Area: 283.53

Pl/SQL procedure successfully completed.
```

Example of these different types of Literals:

Literals	Examples
Numeric	75125, 3568, 33.3333333 etc.
Character	'A' '%' '9' ' ' 'z' '('
String	Hello JavaTpoint!
Boolean	TRUE, FALSE, NULL etc.
Date and Time	'26-11-2002' , '2012-10-29 12:01:01'

PL/SQL Control Statements

Saturday, March 19, 2022 7:27 PM

 PL/SQL supports the programming language features like conditional statements and iterative statements. Its programming constructs are similar to how you use in programming languages like Java and C++

Syntax: (IF-THEN-ELSIF-ELSE statement):

```
IF condition1

THEN

{...statements to execute when condition1 is TRUE...}

ELSIF condition2

THEN

{...statements to execute when condition2 is TRUE...}

ELSE

{...statements to execute when both condition1 and condition2 are FALSE...}

END IF;
```

```
DECLARE

a number(3) := 500;

BEGIN

-- check the boolean condition using if statement

IF( a < 20 ) THEN

-- if condition is true then print the following

dbms_output.put_line('a is less than 20 ' );

ELSE

dbms_output.put_line('a is not less than 20 ' );

END IF;

dbms_output.put_line('value of a is : ' || a);

END;
```

After the execution of the above code in SQL prompt, you will get the following result:

```
a is not less than 20
value of a is : 500
PL/SQL procedure successfully completed.
```

PL/SQL Case Statement

• The PL/SQL CASE statement facilitates you to execute a sequence of statements based on a selector. A selector can be anything such as variable, function or an expression that the CASE statement checks to a Boolean value.

```
pade char(1) := 'A';

BEGIN

CASE grade

when 'A' then dbms_output.put_line('Excellent');

when 'B' then dbms_output.put_line('Very good');

when 'C' then dbms_output.put_line('Good');

when 'D' then dbms_output.put_line('Average');

when 'F' then dbms_output.put_line('Passed with Grace');

else dbms_output.put_line('Failed');

END CASE;

END;
```

After the execution of above code, you will get the following result:

```
Excellent
PL/SQL procedure successfully completed.
```

PL/SQL Exit Loop (Basic Loop)

• PL/SQL exit loop is used when a set of statements is to be executed at least once before the termination of the loop. There must be an EXIT condition specified in the loop, otherwise the loop will get into an infinite number of iterations. After the occurrence of EXIT condition, the process exits the loop.

Syntax of basic loop:

```
LOOP

Sequence of statements;

END LOOP;
```

Syntax of exit loop:

```
LOOP
statements;
EXIT;
{or EXIT WHEN condition;}
END LOOP;
```

```
DECLARE

i NUMBER := 1;

BEGIN

LOOP

EXIT WHEN i>10;

DBMS_OUTPUT.PUT_LINE(i);

i := i+1;

END LOOP;

END;
```

After the execution of the above code, you will get the following result:

```
1
2
3
4
5
6
7
8
9
```

PL/SQL EXIT Loop Example 2

```
DECLARE

VAR1 NUMBER;

VAR2 NUMBER;

BEGIN

VAR1:=100;

VAR2:=1;

LOOP

DBMS_OUTPUT.PUT_LINE (VAR1*VAR2);

IF (VAR2=10) THEN

EXIT;

END IF;

VAR2:=VAR2+1;

END LOOP;

END;
```

Output:

```
100
200
300
400
500
600
700
800
900
```

PL/SQL While Loop

```
DECLARE
i INTEGER := 1;
BEGIN
WHILE i <= 10 LOOP
DBMS_OUTPUT.PUT_LINE(i);
i := i+1;
END LOOP;
END;
```

```
1
2
3
4
5
6
7
8
9
```

PL/SQL FOR Loop

```
DECLARE

VAR1 NUMBER;

BEGIN

VAR1:=10;

FOR VAR2 IN 1..10

LOOP

DBMS_OUTPUT.PUT_LINE (VAR1*VAR2);

END LOOP;

END;
```

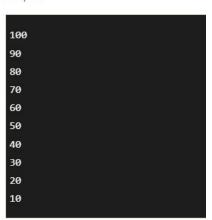

Output:

```
10
20
30
40
50
60
70
80
90
```

PL/SQL For Loop REVERSE

DECLARE VAR1 NUMBER; BEGIN VAR1:=10; FOR VAR2 IN REVERSE 1..10 LOOP DBMS_OUTPUT.PUT_LINE (VAR1*VAR2); END LOOP; END;

Output:

PL/SQL Continue Statement

• For example: If a continue statement exits a cursor FOR LOOP prematurely then it exits an inner loop and transfer control to the next iteration of an outer loop, the cursor closes (in this context, CONTINUE works like GOTO).

```
DECLARE

x NUMBER := 0;

BEGIN

LOOP -- After CONTINUE statement, control resumes here

DBMS_OUTPUT.PUT_LINE ('Inside loop: x = ' || TO_CHAR(x));

x := x + 1;

IF x < 3 THEN

CONTINUE;

END IF;

DBMS_OUTPUT.PUT_LINE

('Inside loop, after CONTINUE: x = ' || TO_CHAR(x));

EXIT WHEN x = 5;

END LOOP;

DBMS_OUTPUT.PUT_LINE (' After loop: x = ' || TO_CHAR(x));

END;

/
```

```
Inside loop: x = 0
Inside loop: x = 1
Inside loop: x = 2
Inside loop, after CONTINUE: x = 3
Inside loop: x = 3
Inside loop, after CONTINUE: x = 4
Inside loop: x = 4
Inside loop, after CONTINUE: x = 5
After loop: x = 5
```

PL/SQL GOTO Statement

```
DECLARE
a number(2) := 30;

BEGIN

<loopstart>>
-- while loop execution

WHILE a < 50 LOOP

dbms_output.put_line ('value of a: ' || a);
a := a + 1;

IF a = 35 THEN
a := a + 1;

GOTO loopstart;

END IF;

END LOOP;

END;
```

```
value of a: 30
value of a: 31
value of a: 32
value of a: 33
value of a: 34
value of a: 36
value of a: 37
value of a: 38
value of a: 39
value of a: 40
value of a: 41
value of a: 42
value of a: 43
value of a: 44
value of a: 45
value of a: 46
value of a: 47
value of a: 48
value of a: 49
Statement processed.
```

Restriction on GOTO statement

Following is a list of some restrictions imposed on GOTO statement.

- o Cannot transfer control into an IF statement, CASE statement, LOOP statement or sub-block.
- o Cannot transfer control from one IF statement clause to another or from one CASE statement WHEN clause to another.
- o Cannot transfer control from an outer block into a sub-block.
- o Cannot transfer control out of a subprogram.
- o Cannot transfer control into an exception handler.
- Oracle provides some attributes known as Implicit cursor's attributes to check the status of DML operations. Some of them are: %FOUND, %NOTFOUND, %ROWCOUNT and %ISOPEN.

Attribute	Description
%FOUND	Its return value is TRUE if DML statements like INSERT, DELETE and UPDATE affect at least one row or more rows or a SELECT INTO statement returned one or more rows. Otherwise it returns FALSE.
%NOTFOUND	Its return value is TRUE if DML statements like INSERT, DELETE and UPDATE affect no row, or a SELECT INTO statement return no rows. Otherwise it returns FALSE. It is a just opposite of %FOUND.
%ISOPEN	It always returns FALSE for implicit cursors, because the SQL cursor is automatically closed after executing its associated SQL statements.
%ROWCOUNT	It returns the number of rows affected by DML statements like INSERT, DELETE, and UPDATE or returned by a SELECT INTO statement.

PL/SQL Implicit Cursor Example

Create customers table and have records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	23	Allahabad	20000
2	Suresh	22	Kanpur	22000
3	Mahesh	24	Ghaziabad	24000
4	Chandan	25	Noida	26000
5	Alex	21	Paris	28000
6	Sunita	20	Delhi	30000

Create procedure:

```
DECLARE

total_rows number(2);

BEGIN

UPDATE customers

SET salary = salary + 5000;

IF sql%notfound THEN

dbms_output.put_line('no customers updated');

ELSIF sql%found THEN

total_rows := sql%rowcount;

dbms_output.put_line( total_rows || ' customers updated ');

END IF;

END;

/
```

Output:

```
6 customers updated
PL/SQL procedure successfully completed.
```

2) PL/SQL Explicit Cursors

The Explicit cursors are defined by the programmers to gain more control over the context area. These cursors should be defined in the declaration section of the PL/SQL block. It is created on a SELECT statement which returns more than one row.

Steps:

You must follow these steps while working with an explicit cursor.

- 1. Declare the cursor to initialize in the memory.
- 2. Open the cursor to allocate memory.
- 3. Fetch the cursor to retrieve data.
- 4. Close the cursor to release allocated memory.

PL/SQL Explicit Cursor Example

Explicit cursors are defined by programmers to gain more control over the context area. It is defined in the declaration section of the PL/SQL block. It is created on a SELECT statement which returns more than one row.

Let's take an example to demonstrate the use of explicit cursor. In this example, we are using the already created CUSTOMERS table.

Create customers table and have records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	23	Allahabad	20000
2	Suresh	22	Kanpur	22000
3	Mahesh	24	Ghaziabad	24000
4	Chandan	25	Noida	26000
5	Alex	21	Paris	28000
6	Sunita	20	Delhi	30000

```
c_id customers.id%type;
c_name customers.name%type;
c_addr customers.address%type;

CURSOR c_customers is

SELECT id, name, address FROM customers;

BEGIN

OPEN c_customers;
LOOP

FETCH c_customers into c_id, c_name, c_addr;
EXIT WHEN c_customers%notfound;
dbms_output.put_line(c_id || '' || c_name || '' || c_addr);
END LOOP;
CLOSE c_customers;
END;
/
```

- 1 Ramesh Allahabad
- 2 Suresh Kanpur
- 3 Mahesh Ghaziabad
- 4 Chandan Noida
- 5 Alex Paris
- 6 Sunita Delhi

PL/SQL procedure successfully completed.

PL/SQL Exception Handling

20 March 2022 14:10

- An error occurs during the program execution is called Exception in PL/SQL
- There are two type of exceptions:
 - o System-defined Exceptions
 - User-defined Exceptions
- Basic Syntax

DECLARE

<declarations section>

BEGIN

<executable command(s)>

EXCEPTION

<exception handling goes here >

WHEN exception1 THEN

exception1-handling-statements

WHEN exception2 THEN

exception2-handling-statements

WHEN exception3 THEN

exception3-handling-statements

......

WHEN others THEN

exception3-handling-statements

END;

Example of Exception Handling

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	23	Allahabad	20000
2	Suresh	22	Kanpur	22000
3	Mahesh	24	Ghaziabad	24000
4	Chandan	25	Noida	26000
5	Alex	21	Paris	28000
6	Sunita	20	Delhi	30000

```
DECLARE
 c_id customers.id%type := 8;
 c name customers.name%type;
 c_addr customers.address%type;
BEGIN
 SELECT name, address INTO c_name, c_addr
 FROM customers
 WHERE id = c_id;
DBMS_OUTPUT.PUT_LINE ('Name: '|| c_name);
DBMS_OUTPUT.PUT_LINE ('Address: ' || c_addr);
EXCEPTION
 WHEN no_data_found THEN
   dbms_output.put_line('No such customer!');
 WHEN others THEN
   dbms_output.put_line('Error!');
END;
```

```
No such customer!
PL/SQL procedure successfully completed.
```

```
DECLARE
 c_id customers.id%type := 5;
 c_name customers.name%type;
 c_addr customers.address%type;
BEGIN
 SELECT name, address INTO c_name, c_addr
 FROM customers
 WHERE id = c_id;
DBMS_OUTPUT.PUT_LINE ('Name: '|| c_name);
DBMS_OUTPUT.PUT_LINE ('Address: ' || c_addr);
EXCEPTION
 WHEN no_data_found THEN
   dbms_output.put_line('No such customer!');
 WHEN others THEN
   dbms_output.put_line('Error!');
END;
```

```
Name: alex
Address: paris
PL/SQL procedure successfully completed.
```

• We can raise the exception explicitly other than the database server.

• We can declare our own user define exceptions

User defined Exceptions

PL/SQL facilitates their users to define their own exceptions according to the need of the program.
 A user-defined exception can be raised explicitly, using either a RAISE statement or the procedure DBMS_STANDARD.RAISE_APPLICATION_ERROR

Syntax for user define exceptions

DECLARE

my-exception EXCEPTION;

Pre defined exceptions

- We already have some pre defined exceptions which are already declared and called when the database rule have been violated by the program.
- We can call them in exception handling or else the compiler calls them automatically when the error have been triggered.

Exception	Oracle Error	SQL Code	Description	
ACCESS_INTO_NULL	06530	-6530	It is raised when a NULL object is automatically assigned a value.	
CASE_NOT_FOUND	06592	-6592	It is raised when none of the choices in the "WHEN" clauses of a CASE statement is selected, and there is no else clause.	
COLLECTION_IS_NULL	06531	-6531	It is raised when a program attempts to apply collection methods other than exists to an uninitialized nested table or varray, or the program attempts to assign values to the elements of an uninitialized nested table or varray.	
DUP_VAL_ON_INDEX	00001	-1	It is raised when duplicate values are attempted to be stored in a column with unique index.	
INVALID_CURSOR	01001	-1001	It is raised when attempts are made to make a cursor operation that is not allowed, such as closing an unopened cursor.	
INVALID_NUMBER	01722	-1722	It is raised when the conversion of a character string into a number fails because the string does not represent a valid number.	
LOGIN_DENIED	01017	-1017	It is raised when s program attempts to log on to the database with an invalid username or password.	
NO_DATA_FOUND	01403	+100	It is raised when a select into statement returns no rows.	
NOT_LOGGED_ON	01012	-1012	It is raised when a database call is issued without being connected to the database.	
PROGRAM_ERROR	06501	-6501	It is raised when PL/SQL has an internal problem.	
ROWTYPE_MISMATCH	06504	-6504	It is raised when a cursor fetches value in a variable having incompatible data type.	
SELF_IS_NULL	30625	-30625	It is raised when a member method is invoked, but the instance of the object type was not initialized.	
STORAGE_ERROR	06500	-6500	It is raised when PL/SQL ran out of memory or memory was corrupted.	
TOO_MANY_ROWS	01422	-1422	It is raised when a SELECT INTO statement returns more than one row.	
VALUE_ERROR	06502	-6502	It is raised when an arithmetic, conversion, truncation, or size-constraint error occurs.	
ZERO_DIVIDE	01476	1476	It is raised when an attempt is made to divide a number by zero.
